

LIGHT BULB HEAD COMPLETE

A Breakthrough by Cole EverDark

Light Bulb head.
by ColeSH.enard

What is this?

This document has been created with heavy preparation for itself and for what it could mean for people with Asperger's and autism this is not a guide. but is a work of reference for the people in any medical field to then take these notes and put them into something more promising and positive effects of LSD. Research treatment

LSD, or lysergic acid diethylamide, is a hallucinogenic drug that was first synthesized by a Swiss scientist in the 1930s. Over time, the drug became a symbol of the 1960s counterculture, eventually joining other hallucinogenic and recreational drugs at rave parties.

sadly i think there is a general issue with over stereotyping this drug for party use and fun. i also think it can be used for science as and i think that the looks we have taken on it.

What is LSD?

LSD (lysergic acid diethylamide), first synthesized in 1938, is an extremely potent hallucinogen. It is synthetically made from lysergic acid, can be stimulating, pleasurable, and mind-altering "

LSD is usually found on the streets in various forms, for example:

- blotter paper (LSD soaked onto sheets of absorbent paper with colourful designs; cut into small, individual dosage units) - the most common form
- the pure liquid form (maybe extremely potent)

What we already know about LSD

LSD is a hallucinogenic Mental stimulant drug that can be used to cause heavy brain growth if there is a massive amount of stimulus to the brain using this Mass stimuli treatment. You can create brain therapies and also treatments to help reconnect certain parts of the brain This overstimulation. in the case and point can be used to create new neural pathways in the brain. that haven't been connected and we're disconnected at Birth meaning you can fix a brain-based on this study. psilocybin, LSD, marijuana, and nicotine, all of these stimuli have different uses and calming mechanisms within our brain LSD are for the actual mental growth portion. The psilocybin for the re-connection portion of connecting mental stimuli nicotine and marijuana is used to keep the heart rate low and which will help patients have a calm mental atmosphere.

This means that this can be a painless process using these chemicals that can bind to create new neural networks that make mental paths grow that weren't there before and by understanding how these Pathways. work and how your brain works you can then rewire your brain to do specific functions at specific points that they weren't able to do before the chemical case in point. have been used to assist some of the smartest and most intelligent people and these people will go on to do great things. everybody deserves a Fighting Chance in this life and everybody deserves to at least try something that improves your life.

All studies that have been found on this drug have been inconclusive and usefulness based on the harsh media criticism that this drug has faced.

i think that alternatively if people with a mental disability had a place that they would feel safe. to perform these experiments that it be great for people to work on arts and sciences.

how the treatment was performed dosages

Nicotine 80 MG

Psilocybin (Magic Mushrooms, Shrooms)

W33D (0.6 MG THC)

LSD 1000 UAGS or 1.0 microgram

If used correctly one can go into a state of thought where your mind finding better ways of doing things I think that this can be used to help a lot of people. I find that some people can overuse this drug but with the right amount of care, it can be beneficial. with people with mental health that their mental health actually. This case in point can be used to retrieve parts of the brain that were never fully developed to develop within a very short period. based on the brain's ability to not see where you panic comes from but needs to be used in certain members of the. to see the most positive effects of this drug should definitely be undergoing major research due to this because it is a permanent long-term fixed. unlike medications methylphenidate Vyvanse and any other psychostimulants. This experimental treatment only cost \$200 and has produced years of neuroreceptor stimulation to a brain that never has had that can become underdeveloped at one point in the fact that LSD. was labelled as a “hippie drug that should have never been used”. I find that this is a constant bias that we live under while on its own because long-term treatment or ADHD hypersensitivity disorder autism spectrum disorder and also high functioning and low-functioning autism has not been found yet this drug. needs to undergo heavy surveillance with the users and this drug should be legally allowed to be studied based on use cases that have been used to solve mental crises. People have used this drug to heighten their senses. This drug has also been used in rare instances to re-stimulate the entire brain to allow full neuro connection to parts of the brain that were not fully stimulated at birth.

In conclusion, the scale of use of this drug goes based on a person's perception awareness-body and body mass index and a bunch of other things as long. As someone can stay alive on this drug then it should be used the real risk of this drug is overused and over intoxication causing long-term psychosis schizophrenia. PTSD and many other mental diseases if this drug is used correctly though in a patient. it can then also use be used to help parts of the brain that were never fully stimulated at Birth causing neuro reconnection to unconnected neurons causing Pathways to open up as yours. the brain keeps firing while this drug is in your body this case in point can cure Asperger's and ADHD. if regular monitoring is in place and regular affect and use scenarios are put in place someone should never go over 2000 UAGS at one time it can cause mental damage.

Albert Hoffman and Bicycle Day

Albert Hoffman, a researcher with the Swiss chemical company Sandoz, first developed lysergic acid diethylamide or LSD in 1938. He was working with a chemical found in ergot, a fungus that grows naturally on rye and other grains.

Hofmann didn't discover the drug's hallucinogenic effects until 1943 when he accidentally ingested a small amount and perceived “extraordinary shapes with an intense, kaleidoscopic play of colours.”

Three days later, on April 19, 1943, he took a larger dose of the drug. As Hofmann rode home from work on his bicycle—World War II restrictions made automobile travel off-limits—he experienced the world's first intentional acid trip.

Years later, April 19 came to be celebrated by some recreational LSD users as Bicycle Day.

our brains are made up of millions upon billions of molecules and atom each one. is derived from an element sometimes our bodies. does not have enough serotonin, to begin with, a lot more can be removed also limited to mental physical and emotional abuse. i find that using drugs that use serotonin over dopamine is more effective for the long term. i find that people that use dopamine have a higher chance of going into psychosis I think that its better to work with serotonin because when your mind. already has enough dopamine then having enough serotonin can correct a lot of things in your body. Serotonin recptors can also be damaged if you have ADHD or autism and especially if you have PTSD I think that it can help a lot and should be strongly suggest also I think that it should be only used for 1 year.
